a quarter of the century has elapsed since i gave my first course in structural reliability to graduate students at the university of waterloo in canada since that time on i have given many courses and seminars to students researchers designers and site engineers interested in reliability i also participated in and was responsible for numerous projects where reliability solutions were required during that period the scope of structural reliability gradually enlarged to become a substantial part of the general reliability theory first it is apparent that bearing structures should not be isolated objectives of interest and consequently that constntcted facilities should be studied second a new engineering branch has emerged reliability engineering these two facts have highlighted new aspects and asked for new approaches to the theory and applications i always state in my lectures that the reliability theory is nothing more than mathematized engineering judgment in fact thanks mainly to probability and statistics and also to computers the empirical knowledge gained by humankind s construction experience could have been transposed into a pattern of logic thinking able to produce conclusions and to forecast the behavior of engineering entities this manner of thinking has developed into an intricate network linked by certain rules which in a way can be considered a type of reliability grammar we can discern many grammatical concepts in the general structure of the reliability theory
